Chapter 1

Introduction and Setup [0 Points]

This assignment aims to implement high-performance prefetching policies for the shared Last Level Cache (LLC). It uses ChampSim, an industry and academic simulator. This document enables you to execute your code on the ECE server. **For the ECE server, please ensure that you have at least 300 MB of free space in the home directory. Please read this document very carefully and in detail.**

You may choose to run this on your personal machine. We do not provide any support for that, *but it is allowed and valid*. However, be warned that some machines may get ‘cooked’ off as they can’t handle these simulations. We are not responsible for such events.

1.1. Preparatory Steps: Setup

1. Kindly delete any previous versions of the **Champsim** folder and **assignment2.tar.gz** on **<username>@ssh.ece.ubc.ca** server. If you want to save this data, you can copy your old **Champsim** folder into your local machine before you delete them.

2. Copy the **assignment3.tar.gz** to the **<username>@ssh.ece.ubc.ca** server.

```
prashantnair@Prashants-Mac-mini Downloads % rsync -avzh --progress --stats assignment3.tar.gz prashantnair@ssh.ece.ubc.ca:~/.  
prashantnair@ssh.ece.ubc.ca's password:  
building file list ...

Number of files: 1  
Number of files transferred: 1  
Total file size: 107.50M bytes  
Total transferred file size: 107.50M bytes  
Literal data: 107.50M bytes  
Matched data: 0 bytes  
File list size: 80  
File list generation time: 0.002 seconds  
File list transfer time: 0.000 seconds  
Total bytes sent: 107.53M  
Total bytes received: 42  
  
sent 107.53M bytes received 42 bytes 4.06M bytes/sec  
total size is 107.50M speedup is 1.00  
prashantnair@Prashants-Mac-mini Downloads %
```

If you do not have rsync installed. You could try installing it or use the scp command. For instance, Mac users can install these tools using Homebrew [1]. Windows and Mac users can use GUI tools like VSCode [2], CyberDuck [3], and MobaXterm [4] (**Windows Only**) to transfer files to remote servers. Linux users can use their *package manager* and install *rsync*, *scp*, or *sftp*.

3. Switch to a bash script by typing the command **bash**. Then untar **assignment3.tar.gz** in the ECE server and change the directory into the **ChampSim** folder.

```
ssh-linux4:~> bash  
prashantnair@ssh-linux4:~$ tar -xzf assignment3.tar.gz  
prashantnair@ssh-linux4:~$ cd ChampSim  
prashantnair@ssh-linux4:~/ChampSim$ ls  
bin                champsim_config_tasktwo.json  docs                run_champsim.sh  
branch            champsim_config_tictac.json  inc                softlinks.sh  
btb               champsim_config_va_ampm_lite.json LICENSE             src  
champsim_config_next_line.json CITATION.cff        Makefile           test  
champsim_config_spp_dev.json compile_champsim.sh  output            tracer  
champsim_config_taskfive.json config              prefetcher         vcpkg  
champsim_config_taskfour.json config.sh           PUBLICATIONS_USING_CHAMPSIM.bib vcpkg.json  
champsim_config_taskone.json CONTRIBUTING.md      README.md          workloads  
champsim_config_taskthree.json create_submission.sh replacement
```

4. ChampSim uses vcpkg to manage its dependencies. In this repository, vcpkg is included as a sub-module. You should bootstrap it with the following command (required only once).

```
prashantnair@ssh-linux4:~/ChampSim$ vcpkg/bootstrap-vcpkg.sh
Downloading vcpkg-glibc...
vcpkg package management program version 2023-08-09-9990a4c9026811a312cb2af78bf77f3d9d288416

See LICENSE.txt for license information.
Telemetry
-----
vcpkg collects usage data in order to help us improve your experience.
The data collected by Microsoft is anonymous.
You can opt-out of telemetry by re-running the bootstrap-vcpkg script with --disableMetrics,
passing --disable-metrics to vcpkg on the command line,
or by setting the VCPKG_DISABLE_METRICS environment variable.

Read more about vcpkg telemetry at docs/about/privacy.md
```

5. Install vcpkg with the following command (required only once).

```
prashantnair@ssh-linux4:~/ChampSim$ vcpkg/vcpkg install
A suitable version of cmake was not found (required v3.27.1) Downloading portable cmake 3.27.1...
Downloading cmake...
https://github.com/Kitware/CMake/releases/download/v3.27.1/cmake-3.27.1-linux-x86_64.tar.gz->/ubc/ece/home/pnj/faculty/prashantnair/ChampSim/vcpkg/downloads/cmake-3.27.1-linux-x86_64.tar.gz

  fmt[x64-linux->10.1.0
  liblzma[x64-linux->5.4.3#1
  nlohmann-json[x64-linux->3.11.2
```

6. Create softlinks for your workloads using the following command (required only once).

```
prashantnair@ssh-linux4:~/ChampSim$ ./softlinks.sh
```

1.2. Preparatory Steps: tmux

1. Start a **tmux** session. This is needed to keep your simulations running even if you get disconnected. **Note that you MUST NOT generate more than one session.**

```
prashantnair@ssh-linux4:~/ChampSim$ tmux new -s champsim-session
```

2. Once inside the session, please type the bash command.

```
ssh-linux4:~/ChampSim> bash
prashantnair@ssh-linux4:~/ChampSim$
```

3. You must now detach this **tmux** session by pressing: **Ctrl+b**, then **d**. We will use **tmux** to execute our simulations later.

```
prashantnair@ssh-linux4:~/ChampSim$ tmux new -s champsim-session
[detached (from session champsim-session)]
prashantnair@ssh-linux4:~/ChampSim$
```

1.3. Preparatory Steps: Compilation

1. You can compile your code with the **compile_champsim.sh** command. For instance, if you have to compile for the **no** prefetching as a policy, you should type

```
prashantnair@ssh-linux4:~/ChampSim$ ./compile_champsim.sh no
```

2. The following policies are valid policy names that can be supplied to the compilation script: **no**, **next_line**, **spp_dev** [5], **va_ampm_lite** [6], **taskone**, **tasktwo**, **taskthree**, **taskfour**, **taskfive**, or **tictac**. The policies in red would not compile without you first implementing these policies.
3. These policies must be implemented at **prefetcher/<policyname>/<policyname>.cc**
4. You can ONLY edit the files for the policies in red. For these, you can edit ONLY **prefetcher/<policyname>/<policyname>.cc**. **You MUST NOT edit any other folders or files in ChampSim. You will directly get ZERO points if you do.**
5. If your compilation is successful. You will see a statement at the end of the compilation. This would look as follows for the **no** prefetcher policy.

```
Configuration build complete for no. The binary is now named champsim-no.
```

1.4. Preparatory Steps: Execution

1. Before you execute your code. You should switch to the **tmux** session that you created. You may do so using the following command.

```
prashantnair@ssh-linux4:~/ChampSim$ tmux attach -t champsim-session
```

2. You will be taken to the same **tmux** session screen where you left off before detaching from **tmux**.

```
ssh-linux4:~/ChampSim> bash
prashantnair@ssh-linux4:~/ChampSim$
```

3. You can execute your **no** prefetching policy code with the **run_champsim.sh** command by typing **./run_champsim.sh no**
4. You may detach from the **tmux** screen once the simulations start. Your assignment has nine workloads. The simulation time, per workload, will vary. You may take nearly *one hour per simulation* to run across workloads. DO NOT EDIT any of the simulation scripts.
5. Make sure you kill your simulations before you start new simulations. You can kill a simulation by attaching your **tmux** session and typing **Ctrl+C**.
6. You can monitor the progress of your simulation run by typing the **htop** command.
7. You may iterate Preparatory Steps 1.2, 1.3, and 1.4 for **next_line**, **spp_dev** [5], and **va_ampm_lite** [6] policies – these policies are already implemented in ChampSim.
8. You can see the outputs of your runs in the **outputs/<policyname>** folder. The outputs are log files with the names of the SPEC2006 benchmarks.
9. For each benchmark, you will primarily be interested in LLC statistics like a fraction of useful prefetches (see log file for LLC PREFETCH REQUESTED and its associated metrics), LLC hit-rate, and CORE IPC values (you find other statistics interesting as well).
10. **Note that: For this assignment, your baseline system policy employs no prefetching. You would need to compare the metrics of your implemented policies, such as IPC and LLC hit-rate, to no prefetching.**
11. ChampSim also provides **next_line**, **spp_dev** [5], and **va_ampm_lite** [6] policies. You may run them too (especially if you are implementing **tictac**) if you like.

Chapter 2

Evaluation: Prefetch Policies [5 + 1 Points]

These policy simulations take a long time. Once you implement them, you would need **nearly a week to simulate** these different policies. So please start your implementation today itself!

2.1. Policies

1. **[1 Point]** Implement a prefetching policy that prefetches the next two cachelines after the address accessed (within the `prefetcher_cache_operate()` function). This is called **taskone**.

For instance, if your `prefetcher_cache_operate` function accesses the physical address **A**, **taskone** will prefetch **A+1** and **A+2** cachelines. You may refer to the code for **next_line** for a starting reference.

You may ONLY edit the file `prefetcher/taskone/taskone.cc` for this. You can compile your implementation using `./compile_champsim.sh taskone` command. You can then attach your **tmux** session and run this using the `./run_champsim.sh taskone` command.

2. **[1 Point]** Implement a prefetching policy that prefetches the three cachelines before and after the address accessed (within the `prefetcher_cache_operate()` function). This is called **tasktwo**.

For instance, if your `prefetcher_cache_operate()` function accesses the physical address **A**, **tasktwo** will prefetch **A-3**, **A-2**, **A-1**, **A+1**, **A+2**, and **A+3** cachelines. You may refer to the code for **next_line** for a starting reference.

You may ONLY edit the file `prefetcher/tasktwo/tasktwo.cc` for this. You can compile your implementation using `./compile_champsim.sh tasktwo` command. You can then attach your **tmux** session and run this using the `./run_champsim.sh tasktwo` command.

3. **[1 Point]** Implement a prefetching policy called **taskthree**. It follows the following rules:

- For each call of the `prefetcher_cache_operate()` function, **taskthree** looks at a tracker.
- This tracker keeps track of the cacheline addresses for the last three cache misses. Note that this is a ‘moving’ window.
- It computes the offsets between these addresses.
- If a majority of the cacheline address offsets are the same, it uses this offset to prefetch a cacheline.
- If the cacheline address offsets differ, it prefetches using the next line prefetcher.

You must read and understand the `src/cache.cc` file to fully understand how to achieve this and track cache misses within the prefetcher. We **will not** help you – the goal here is to understand the simulator more deeply, thus an evaluation criteria for us. You may also refer to **next_line**, **spp_dev** [5], and **va_ampm_lite** [6] policies for additional understanding.

You may ONLY edit the file `prefetcher/taskthree/taskthree.cc` for this. You can compile your implementation using `./compile_champsim.sh taskthree` command. You can then attach your **tmux** session and run this using the `./run_champsim.sh taskthree` command.

4. **[0.5 Points]** Implement a prefetching policy called **taskfour**. It follows the following rules:

- You must compute the fraction of hits into prefetched lines. So if the cache had 100 hits, and out of those, 5 came from prefetched lines, your fraction is 10%.

- If this fraction exceeds 10%, you must execute the policy implemented in **taskthree**. Note that you will need to rewrite the code for this task.
- However, if the fraction of hits from prefetches is equal to or below 10%, you must execute the policy implemented in **tasktwo**.
- These choices must be made every time the `prefetcher_cache_operate()` function is called.

You must read and understand the `src/cache.cc` file to fully understand how to achieve this and track cache misses within the prefetcher. We **will not** help you – the goal here is to understand the simulator more deeply, thus an evaluation criteria for us. You may also refer to `next_line`, `spp_dev` [5], and `va_ampm_lite` [6] policies for additional understanding.

You may ONLY edit the file `prefetcher/taskfour/taskfour.cc` for this. You can compile your implementation using `./compile_champsim.sh taskfour` command. You can then attach your `tmux` session and run this using the `./run_champsim.sh taskfour` command.

5. **[0.5 Points]** Implement a prefetching policy called **taskfive**. It follows the following rules:

- You must compute the fraction of hits into prefetched lines. So if the cache had 100 hits, and 30 came from prefetched lines, your fraction is 30%.
- If this fraction exceeds 30%, you must execute the policy implemented in **taskthree**.
- However, if the fraction of hits from prefetches is equal to 30% and until 20%, you must execute the policy implemented in **tasktwo**.
- However, if the fraction of hits from prefetches is equal to 20% and until 10%, you must execute the policy implemented in **taskone**.
- However, if the fraction of hits from prefetches is equal to 10% and until 0%, you must execute the `next_line` prefetcher.
- These choices must be made every time the `prefetcher_cache_operate()` function is called.

You must read and understand the `src/cache.cc` file to fully understand how to achieve this and track cache misses within the prefetcher. We **will not** help you – the goal here is to understand the simulator more deeply, thus an evaluation criteria for us. You may also refer to `next_line`, `spp_dev` [5], and `va_ampm_lite` [6] policies for additional understanding.

You may ONLY edit the file `prefetcher/taskfive/taskfive.cc` for this. You can compile your implementation using `./compile_champsim.sh taskfive` command. You can then attach your `tmux` session and run this using the `./run_champsim.sh taskfive` command.

6. **[1 Point] – BONUS (optional)** Implement your own prefetching policy – let us call this policy (**tictac**). You can ONLY use a maximum of 16KB additional overheads for the entire prefetcher. This can be in the form of a table, or however you like. **If you exceed this limit, you will get a ZERO in the entire assignment.** Note that this needs to be a new policy. It cannot be a replica of published policies.

You may ONLY edit the file `prefetcher/tictac/tictac.cc` for this. You can compile your implementation using `./compile_champsim.sh tictac` command. You can then attach your `tmux` session and run this using the `./run_champsim.sh tictac` command.

To get this BONUS point, (i) Your policy must be among the top 10 speedups from the **tictac** submissions in the class *AND* (ii) you should report your speedup (using geomean) by comparing your **tictac** implementation to the `next_line` prefetcher. *We will start an anonymous tracking sheet for this soon.* You will not be graded for this bonus point if you do not add your name to this tracker and report your performance.

7. **[1 Point]** Write a report in pdf format explaining how you implemented **taskone**, **tasktwo**, **taskthree**, **taskfour**, **taskfive**, and **tictac** (optional) policies. This pdf should also have graphs that compare IPC (normalized and actual IPC across policies), hit rates, prefetch accuracy, and other key metrics you deem fit. You should be able to explain your results convincingly, exhaustively, and logically in this document. There is a page limit of 5 pages. **Place your report within the ChampSim folder.**

2.2. A Few Pro Tips

1. If you have <1 week remaining and have not started your simulations, you may struggle to complete this assignment (if you use an ECE server). So start early!
2. Please learn how to track your jobs using the **top** and/or **htop** commands.
3. You DO NOT need to run your simulations only on **ssh-linux4** or whatever server you get during login. You can use **htop** and check if this server is busy with other jobs from other students. If so, you can ssh to other servers. This will help balance the load. We have **ssh-linux1**, **ssh-linux2**, **ssh-linux3** and **ssh-linux4** servers. For instance, once you login, can ssh into **ssh-linux1** from **ssh-linux4** by typing the command as follows:
4. Please kill your simulations before you restart a run. Otherwise, your simulations will stack up, and that will cause **immense slowdowns** for you.
5. For faster development, learn to use **vi**, **vim**, or **emacs**.
6. **Important:** You can test your code for fewer instructions and only a few benchmarks before instantiating a full run. This can be done via the command line as follows:

```
jheonhyunwoo@Jeonhyuns-Laptop.local:~/OneDrive - UBC/TA/CPEN 411/2024/Assignments/Assignment2 $ ssh jhwoo36@ssh-linux1.ece.ubc.ca
```

```
prashantnair@ssh-linux4:~/ChampSim$ ./bin/champsim-next_line --warmup-instructions 2000000 --simulation-instructions 5000000 workloads/astar.trace.xz ]
WARNING: physical memory size is smaller than virtual memory size.

*** ChampSim Multicore Out-of-Order Simulator ***
Warmup Instructions: 2000000
Simulation Instructions: 5000000
Number of CPUs: 1
Page size: 4096

Off-chip DRAM Size: 64 GiB Channels: 2 Width: 64-bit Data Rate: 3200 MT/s
Warmup finished CPU 0 instructions: 2000001 cycles: 500046 cumulative IPC: 4 (Simulation time: 00 hr 00 min 03 sec)
Warmup complete CPU 0 instructions: 2000001 cycles: 500046 cumulative IPC: 4 (Simulation time: 00 hr 00 min 03 sec)
```

Here, we are testing the **next_line** prefetching policy on the **astar** benchmark with a warm-up of only 2 million instructions and execution of only 5 million instructions. This will be a quick run; you won't have to use **tmux**.

Note that the main submission warms up for 50 million instructions and executes an additional 50 million instructions for each benchmark.

7. If you have time, learn how to use the [tracer folder](#) to develop your **own traces** of tailored access patterns. The tracer uses **Pin**, and this strategy will help you debug with your tailored binaries. You can check if your cache policy provides the expected hit rates for your custom trace.

Chapter 3

Submission Instructions

1. Before submitting your assignment, please kill the **tmux** session as follows:

```
prashantnair@ssh-linux4:~$ tmux ls
champsim-session: 1 windows (created Tue Oct 8 19:55:27 2024)
prashantnair@ssh-linux4:~$ tmux kill-session -t champsim-session
prashantnair@ssh-linux4:~$ tmux ls
no server running on /tmp/tmux-18623/default
prashantnair@ssh-linux4:~$
```

2. To submit, please execute the following command within the ChampSim folder.

```
prashantnair@ssh-linux4:~/ChampSim$ bash create_submission.sh
```

3. You can then run **rsync** from your local computer and download the submission file.

```
prashantnair@Prashants-Mac-mini Downloads % rsync -avzh --progress --stats prashantnair@ssh.ece.ubc.ca:~/ChampSim/submission.tar.gz submission.tar.gz
prashantnair@ssh.ece.ubc.ca's password:
receiving file list ...
1 file to consider

Total file size: 10.22K bytes
Total transferred file size: 10.22K bytes
Literal data: 10.22K bytes
Matched data: 0 bytes
File list size: 81
File list generation time: 0.002 seconds
File list transfer time: 0.000 seconds
Total bytes sent: 38
Total bytes received: 10.34K

sent 38 bytes received 10.34K bytes 902.78 bytes/sec
total size is 10.22K speedup is 0.98
```

4. If and only if you have implemented **tictac**, write a comment in your submission with the speedup number and your pseudonym in the Excel sheet. You DO NOT need to write a comment if you did not implement **tictac**.

We will evaluate your tictac implementation ONLY if we see this comment. So do not forget to write this if you did implement a competitive policy.

5. Please upload **ONLY** the **submission.tar.gz** on Canvas. **If we find stale files and execute those, you can get “ZERO” points for this assignment.**

6. Thus, be extremely careful and double-check if your source files and other things are right! We have 80 students and will not re-evaluate your assignment if you submit incorrect or stale work.
